

SECURITY SYSTEMS

Security systems are essential in any residential home or commercial business of any size. Approximately 75% of security system sales are generated from consumers who have been robbed or vandalized. In most cases the losses incurred would have made up for the cost of a security system and monitoring. At AIS we will design a security system tailored to your specific needs. We take into consideration layout, environment, users, and budget. We provide state of the art equipment with the most available options, focusing on ease of use for the end user.

CCTV is becoming the wave of the future in security monitoring. With the new technology available video images can be sent to our central station along with the alarm signal, helping to accurately verify the cause of the alarm. This can significantly reduce the cost and wasted time the police departments spend on false alarms.

Whether you require a single camera with a simple time-lapse VCR, or a multi-camera surveillance system fully integrated and networked to multiple sites, AIS can help. The design and placement of your cameras are essential for proper protection. You can count on our highly trained designers to engineer the system best for you within your budget.

With **Access Control** there is no longer a need for keys and locks when terminating an employee. You simply delete the employee's access information with a few simple key strokes. An access control system protects equipment, inventory, and information by means of controlling access to certain areas, and systems can be designed to work in conjunction with your burglar and/or fire alarm system.

The system can also be set up to monitor traffic within the building by providing reports such as the time employees arrive, which rooms they enter, and when they exit the building. Whether your business is small or large, there are many options available with access control.

"Making your safety and security our priority."
